

JTGGA CME/CPD CREDITING

Answer form for the article titled “ Perioperative considerations in the treatment of endometriosis” within the scope of CME/CPD

1. The mean period of time from the onset of initial symptoms to the confirmed diagnosis of endometriosis is:

- a. 12-24 months
- b. 2-4 years
- c. 5-6 years
- d. >8 years

2. Which statement is true for diagnostic investigation of suspected endometriosis?

- a. The speculum should be set to inspect the anterior fornix.
- b. In case of a well-founded suspicion of endometriosis based on the patient’s medical history and clinical investigation, one should dispense with a laparoscopy.
- c. The speculum should be set specifically to inspect the posterior fornix.
- d. A rectovaginal investigation is needed in very rare cases.

3. Which statement is true for the ultrasound diagnostic investigation of endometriosis?

- a. A structured diagnostic approach may be omitted.
- b. The sensitivity and specificity of transvaginal ultrasound for the diagnosis of endometriosis is about 25% and 35%, respectively.
- c. The Morphological Uterus Sonographic Assessment (MUSA) group criteria are well suited for the diagnosis of peritoneal endometriosis.
- d. The International Deep Endometriosis Analysis (IDEA) group provides specific recommendations for the diagnostic procedure in cases of suspected deep infiltrating endometriosis.

4. Which of these statements is true for adenomyosis?

- a. Typical symptoms are hypomenorrhea and non-cyclical pain in the lower abdomen.
- b. The computed tomography (CT) investigation permits an accurate diagnosis.
- c. The Morphological Uterus Sonographic Assessment (MUSA) group criteria should be used for diagnostic evaluation.
- d. Adenomyoma can be clearly differentiated from myoma on ultrasound investigation.

5. Which of these statements is true for endometrioma?

- a. Endometrioma is frequently marked by strong vascularization of the cyst wall.
- b. In rare cases it is associated with further endometriosis lesions.
- c. Recurrence rates are the same after complete cyst enucleation and after reduction of endometrioma.
- d. The presence of “kissing ovaries” is associated with co-existing deep infiltrating endometriosis.

6. A 36-year-old woman with an unfulfilled desire for children and dysmenorrhea came for consultation and diagnosis. She also complained of cycle-related dyschezia. On being questioned specifically, she reported dyspareunia. These symptoms are imposing a significant burden on her sexual relationship. The patient finds it very unpleasant to discuss these problems.

- a. In this case one should definitely dispense with a detailed medical history.
- b. Further diagnostic investigations by way of a gynecological examination, including transvaginal ultrasound, will provide no additional benefit and will be an additional burden for the patient.
- c. Further diagnostic investigations should include an endosonography and a colonoscopy.
- d. Any further treatment should be focused on the sexual partner.
